

AI + Automation in 2026

Why AI is Changing Test Automation

Artificial Intelligence is transforming automation testing. Instead of writing only static scripts, AI can now:

- Auto-heal broken locators
- Generate test cases automatically
- Detect visual differences intelligently
- Predict high-risk areas in applications

AI + Automation = Faster releases + Smarter testing + Less maintenance

Example: Playwright + AI-style Self-Healing Logic (Concept Demo)

```
# Example: Smart Locator Fallback Logic (Python + Playwright)
```

```
from playwright.sync_api import sync_playwright
```

```
def click_with_fallback(page):  
    try:  
        page.locator("#login-btn").click()  
    except:  
        print("Primary locator failed. Trying fallback...")  
        page.locator("text=Login").click()
```

```
with sync_playwright() as p:  
    browser = p.chromium.launch(headless=False)  
    page = browser.new_page()  
    page.goto("https://example.com")  
    click_with_fallback(page)  
    browser.close()
```

```
# In real AI frameworks, ML models suggest best alternative locators automatically.
```

How to Start with AI in Automation

- Step 1: Master one automation tool (Playwright / Selenium / Cypress).
- Step 2: Learn basics of Python or Java for AI integrations.
- Step 3: Explore AI-based tools like self-healing frameworks.
- Step 4: Practice building small smart automation utilities.

Interview Trend Insight (2026)

Interviewers are now asking:

- How would you reduce flaky tests using AI?
- Can automation predict production defects?
- How would you integrate AI with CI/CD?

AI knowledge is becoming a strong differentiator in automation interviews.
